

TECHNIQUE T855: UNAUTHORIZED COMMAND MESSAGE

CyOTE Use Case(s)	MITRE ATT&CK for ICS [®] Tactic
Alarm Logs, HMI	Impair Process Control
Data Sources	
Potential Data Sources	Packet Captures, Network Protocol Analysis, OS Stack Logs, Application Logs
Historical Attacks	Industroyer/CRASHOVERRIDE, ¹ Triton Attack at Petro Rabigh ²

TECHNIQUE DETECTION

The Unauthorized Command Message technique³ (Figure 1) may be detected if devices are given commands that go outside of their intended function or out of expected order.

To augment commercial sensor gaps, the CyOTE program has developed capabilities such as Proof of Concept tools⁴ and Recipes⁵ for asset owners and operators (AOO) to identify indicators of attack for techniques like Unauthorized Command Message within their operational technology (OT) networks. Referencing CyOTE Case Studies⁶ of known attacks, AOOs in both small and large organizations can utilize CyOTE’s Use Case analyses to tie operational anomalies and observables to cyber-attack campaigns resulting in ever-decreasing impacts.

PERCEPTION: OBSERVABLES FROM HISTORICAL ATTACKS

The Unauthorized Command Message technique was used in the Industroyer attack in the Ukraine in 2016^{7,8} and in the Triton attack at Petro Rabigh in 2017.⁹ In these attacks, the following observables were identified:

- An increase of packet traffic

¹ MITRE, Software: Industroyer, CRASHOVERRIDE, <https://collaborate.mitre.org/attackics/index.php/Software/S0001>

² MITRE, Software: Triton, TRISIS, HatMan, <https://collaborate.mitre.org/attackics/index.php/Software/S0013>

³ MITRE ATT&CK for ICS, T855: Unauthorized Command Message, <https://collaborate.mitre.org/attackics/index.php/Technique/T0855>

⁴ A Proof of Concept tool is a representative implementation of a set of steps and methods for identifying techniques. A Proof of Concept tool is defined as a script(code) or using capabilities of existing tools (e.g., Splunk, Gravel), to demonstrate the capability to identify adversarial activity for a selected technique. A Proof of Concept tool is not ready for implementation in an AOO’s environment as its major focus is to a specific instance (device, vendor, protocol, scenario) in order to prove a concept.

⁵ A Recipe is a set of steps and methods for identifying techniques. Recipes can be used to develop a Proof of Concept or operational tool in an AOO’s OT environment.

⁸ <https://www.dragos.com/wp-content/uploads/CRASHOVERRIDE.pdf>

⁹ <https://www.eenews.net/stories/1060123327>

- Increased DMZ traffic between information technology (IT) and OT networks
- Blocking of command messages
- Event logs showing devices performing unexpected functions
- Unfamiliar IP addresses noted in NetFlow logs

Disclaimer: Past occurrences are not guaranteed to occur in future attacks.

COMPREHENSION

In the Industroyer attack, the adversary issued unauthorized command messages to devices to change their program state and execute further control of the system. They were able to do this once they had gained access to the Data Historian to initiate the compromise and had begun issuing malicious commands. They were then able to take control of the system and manipulate it to cause impactful and damaging changes.¹⁰

In the Triton attack, the adversary issued unauthorized command messages as part of their execution of the attack after having moved into the OT network. They first gained access through an engineering workstation to deploy the malware; once they gained control of the workstation, they modified operating modes on devices and modified device logic to issue malicious command messages and shut down part of the plant.¹¹

By understanding the nature and possible origins of these attacks, as well as how the adversaries used the Unauthorized Command Message technique to execute the attacks, an AOO can better comprehend how this technique is used with others and enhance their capabilities to detect attack campaigns using this technique and decrease an attack's impacts.

CURRENT CAPABILITY

The CyOTE Proof of Concept tool reads a network traffic capture and analyzes it based upon a set of criteria defined in a separate configuration file. The criteria compare the protocol layer fields to static values, alerting on trusted IP lists for unauthorized traffic detection, and validating the Common Industrial Protocol (CIP). This Proof of Concept tool output provides statistics about triggered criteria, such as number of times triggered, which packets caused the trigger, data about the network streams, and which network streams included the full protocol cycle or only a part. The protocol validation summary also identifies the packets associated with validation (or lack thereof).

POTENTIAL ENHANCEMENTS

Additional research is needed to tailor the CyOTE Proof of Concept tool to monitor network traffic for commands issued from a non-authorized device. The tool will use a user-defined list of allowed hosts (in the configuration file) permitted to communicate and provide commands to a device, such as a human-machine interface (HMI) and/or engineering workstation.

ASSET OWNER DEPLOYMENT GUIDANCE

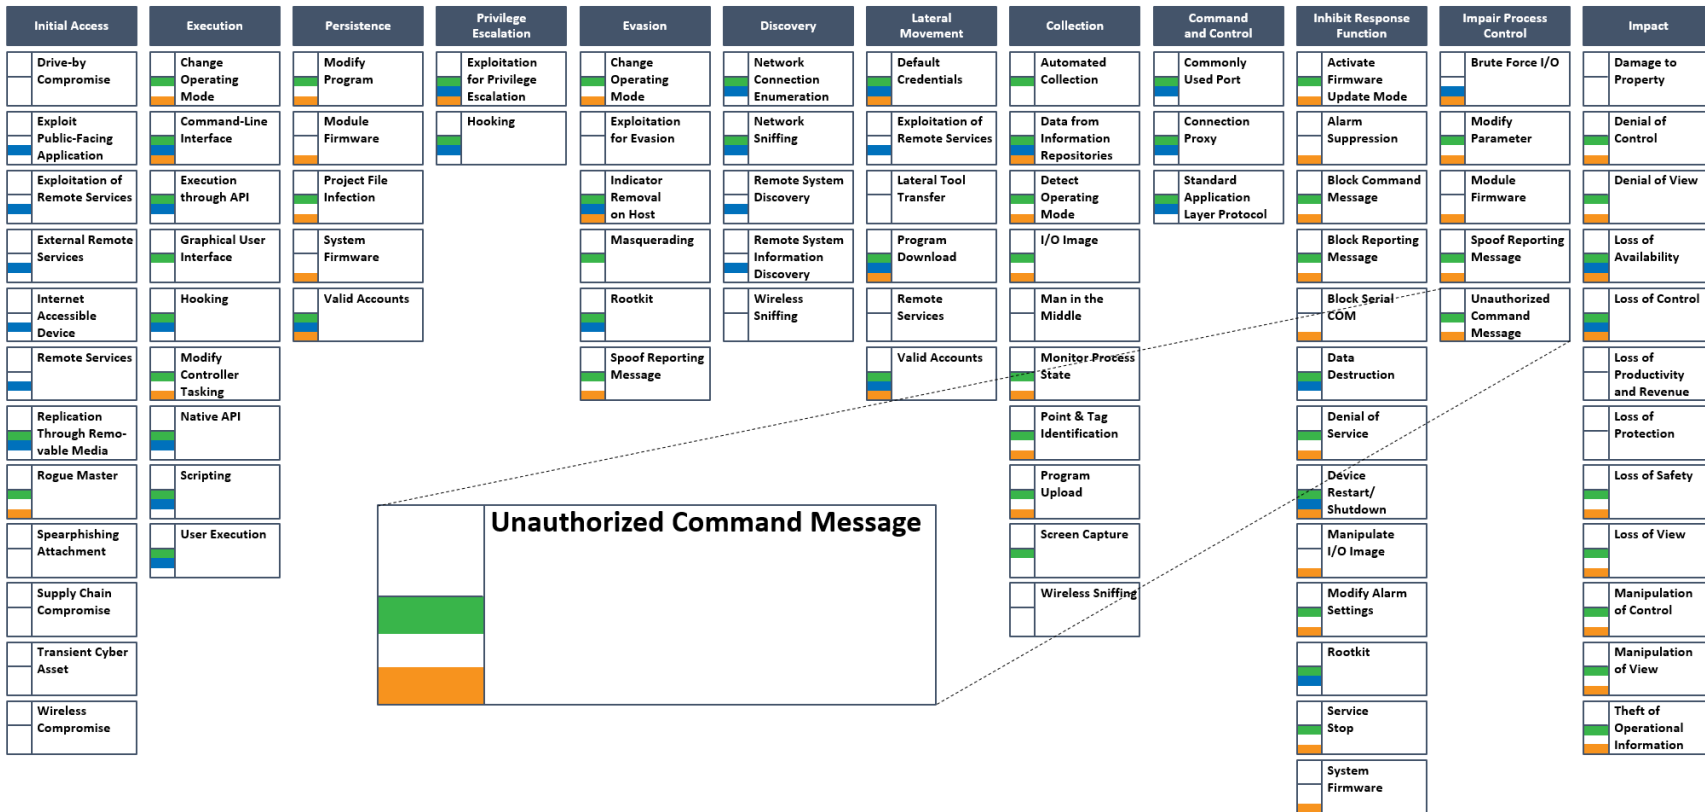

The CyOTE Proof of Concept tool can be used in a continuously monitoring state by connecting it to a span port of the desired network. This Proof of Concept tool can also be used offline by ingesting network traffic in a Packet Capture (PCAP) file. The operational tool should alert on hosts issuing commands. The command list can be reduced by providing a list of authorized hosts. Alerts can be customized to output to a syslog entry or a STIX 2.1 format.

AOOs can refer to the CyOTE Technique Detection Capabilities report (visit <https://inl.gov/cyote/>) for more information on the background and approach of CyOTE's technique detection capabilities.

AOOs can also refer to the [CyOTE methodology](#) for more information on CyOTE's approach to identifying anomalies in an OT environment, which, when perceived, initiates investigation and analysis to comprehend the anomaly.
